**Young T.; Kalchbrenner, L.; Mink, T.; Allen, A.; Tatarski, R**

# Road Map

# What is Pickleball?

2024<sup>1</sup>

19.8 Million Players

311% growth since 2022

33.5% of players are 25-34

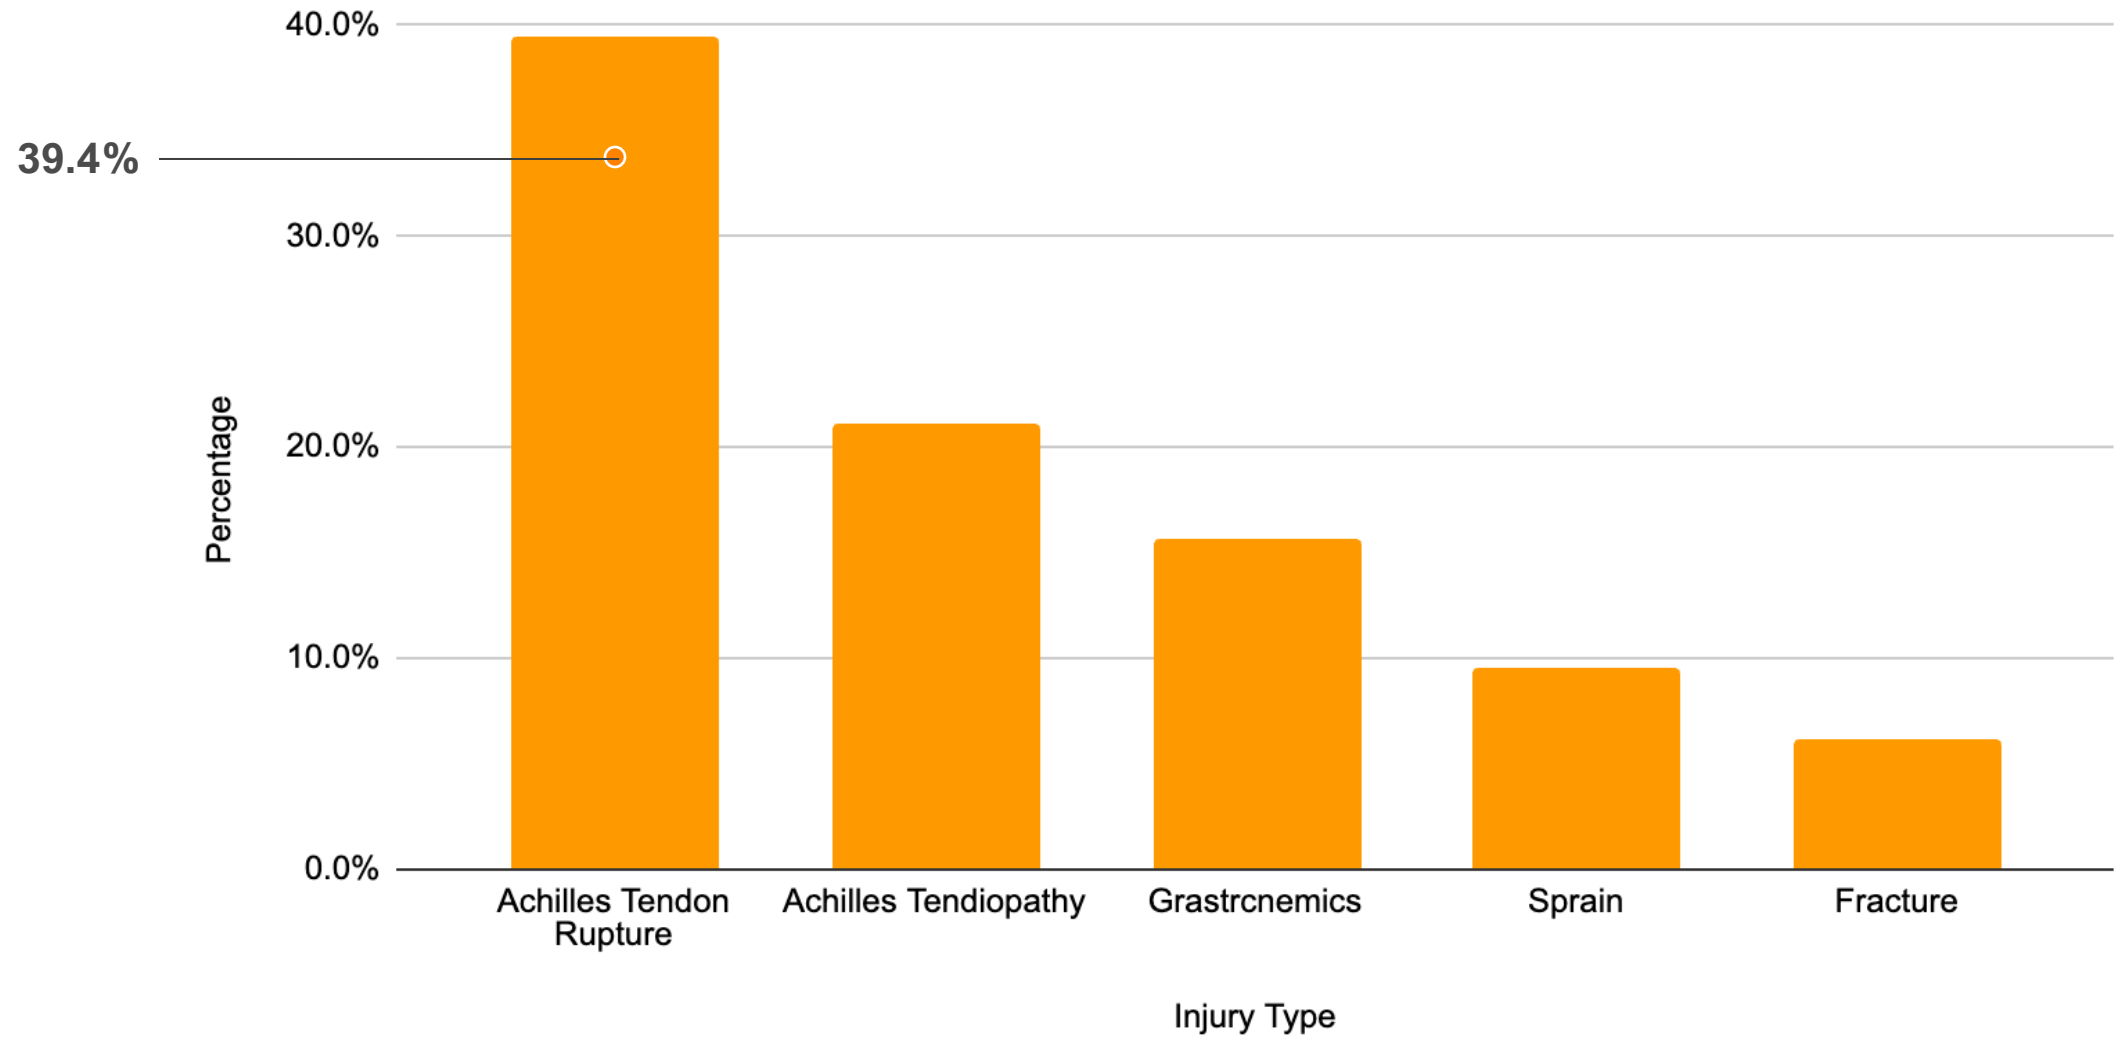

40%<sup>2</sup>

## Achilles Tendon Ruptures

## Ankle Injuries (2019 - 2023)

# Research Question

- Research Question
  - What is the effect of acute ankle stretching protocol on ankle biomechanics during cutting maneuvers for young adults?
- Machine Learning Question
  - Do biomechanical subgroups, based on pre- and post-pickleball movement ankle range of motions, emerge with distinct demographic profiles?

# Methods

- Within Subject
- Two day event
  - Day 1 - Baseline
  - Day 2 - Stretching intervention
- Captured Static Range of Motion

Figure 1: Straight leg stretch at 30 degrees dorsiflexion (4 X 30 seconds)

Figure 2: Flexed leg stretch at 30 degrees dorsiflexion (4 X 30 seconds)

# Participants

- Data is paired
  - Every subject has a pre - post for same day
- Normally distributed
  - Day 1: N = 29
  - Day 2: N = 29

Variable	Average	SD
Age	33.03	16.16
Height	1.73	0.10
Gender	0.58	0.10
Shoe Size	9.41	1.79
Leg Dominance	0.13	0.35
Arm Dominance	0.13	0.35
# of times playing	0.62	0.49

Table 1: Age in years, Height in meters, Gender with 0 as female and male as 1, Dominance with 0 as right and 1 as left, # of times playing with 0 casual and 1 as core player. Refer to code book

# Workflow

Preprocessing

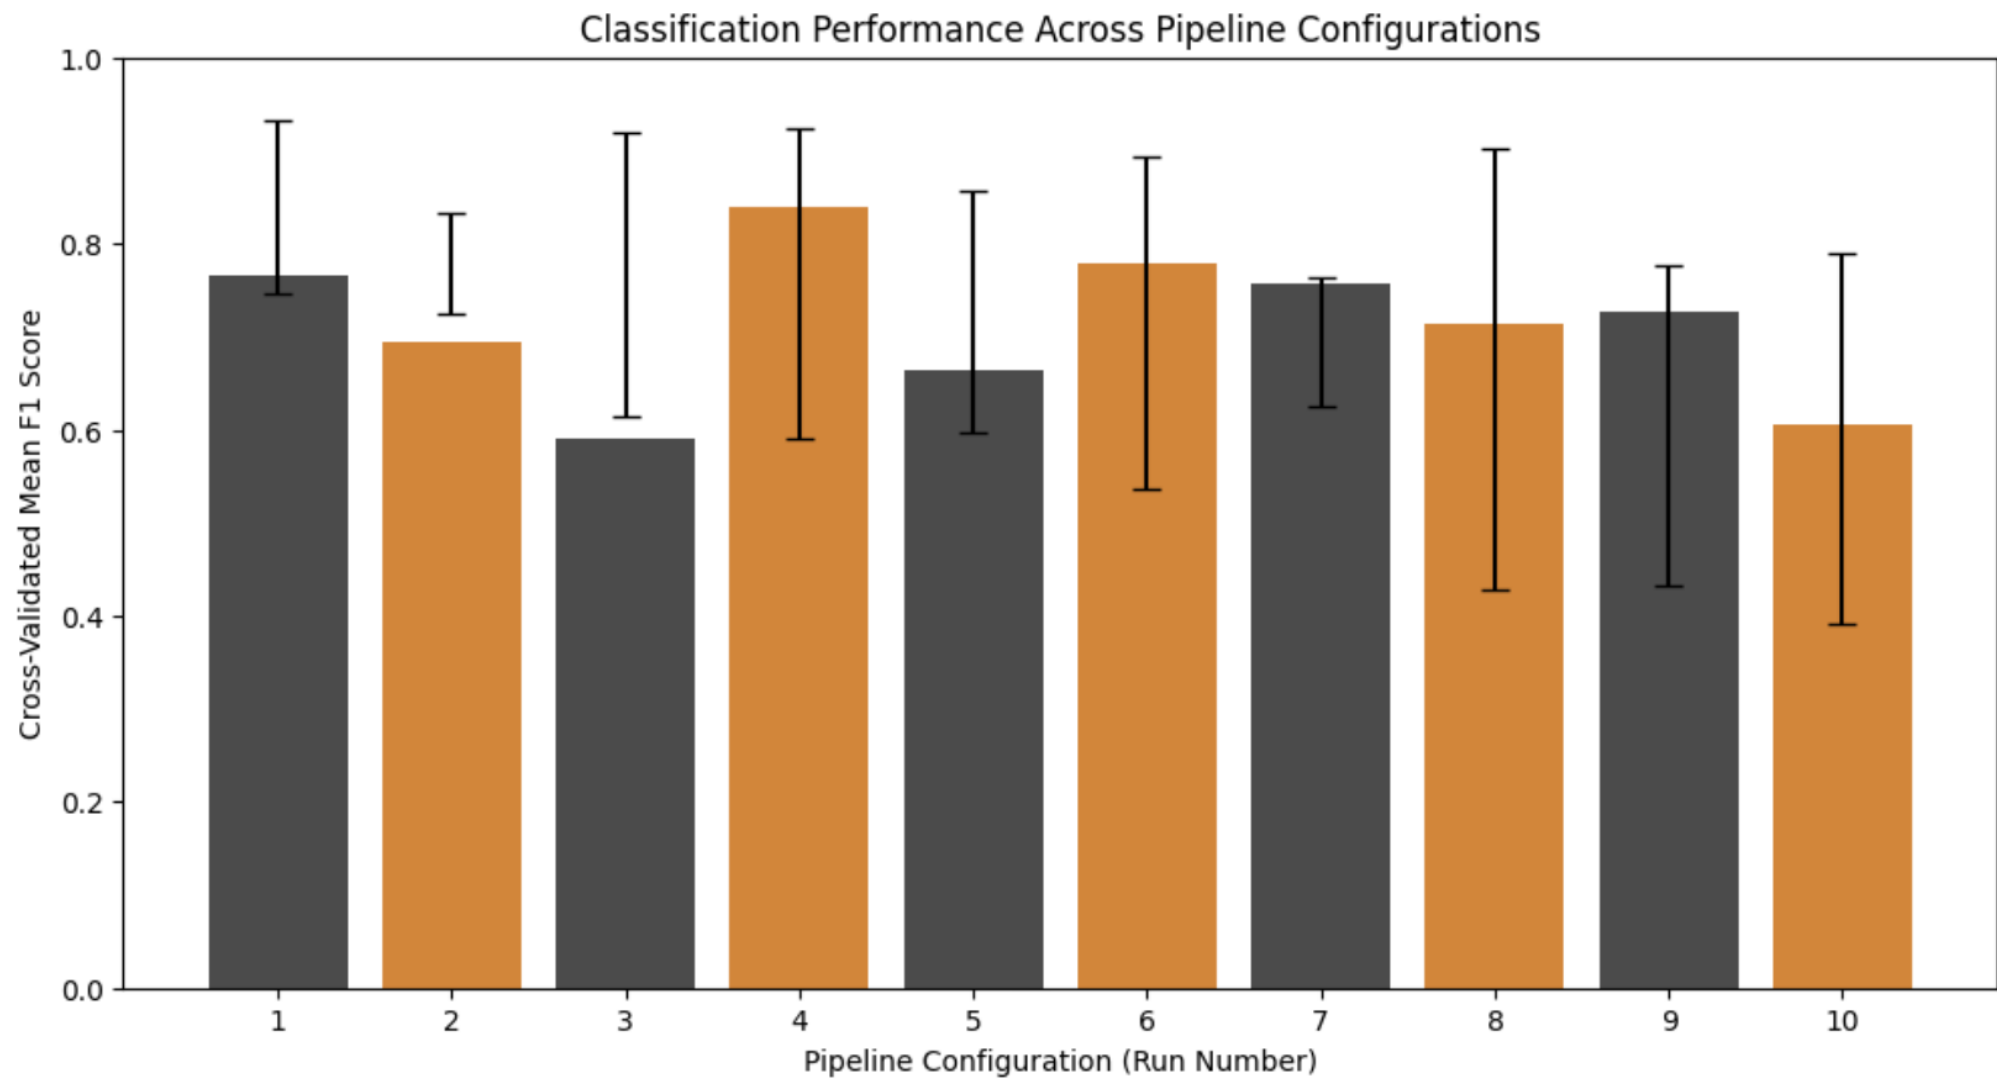

Processing

Post-Processing

# Pipelines

Run 1: t-SNE Only + Agglomerative Clustering + Random Forest + Feature Selection

Run 2: PCA + t-SNE + KMeans + Logistic Regression + Feature Selection

Run 3: PCA + t-SNE + KMeans + Naive Bayes + Feature Selection

Run 4: PCA + t-SNE + Agglomerative Clustering + Logistic Regression + Feature Selection

Run 5: Fusion: PCA + t-SNE + KMeans + Voting Classifier (RF, NB, Logistic) + Feature Selection

Run 6: t-SNE Only + KMeans + Random Forest + Feature Selection

Run 7: t-SNE Only + Agglomerative Clustering + Logistic Regression + Feature Selection

Run 8: t-SNE Only + KMeans + Naive Bayes + Feature Selection

Run 9: t-SNE + PCA + KMeans + SVM + Feature Selection

Run 10: t-SNE + PCA + KMeans + GBDT + Feature Selection

Classification Performance vs. Clustering Quality

## Top 5 Features

# Findings

- Baseline ankle ROM was a strong predictor of how an individual's ankle ROM will change after pickleball movements and stretching.
- Those with limited initial flexibility might be more prone to changes / improvements with the intervention.
- Age, since range was between 18 and 80 years old, was an important feature that separated clusters.
- Post2 features might indicate that the stretching intervention has the potential to improve specific aspects of ankle ROM that are relevant to pickleball performance / injury risk.
